MOMENTUS

MOMENT US

SMART INVITATIONS | TIMELESS EXPERIENCES

Product Feature & Technical Specification

NFC-powered invitations, personalized event websites, guest access, redemption, and post-event memories.

Concept specification • Version 1.0 • November 2026

01 Product vision

MOMENTUS (pronounced “Moment Us”) is a premium, multi-tenant smart event experience platform. It combines beautifully produced NFC invitation cards with customized, animated event microsites and a single guest identity usable before, during, and after an event.

Positioning: More than an invitation: a connected guest journey and an event operations system for couples, organizers, venues, and brands.

Initial target: Weddings and debuts in the Philippines. Expansion: corporate events, conferences, exhibitions, graduations, hotels, resorts, concerts, and festivals.

02 Guest lifecycle

Stage	Guest experience	Organizer capability
Before	Receive branded NFC/QR card; tap to view personalized invitation; RSVP; explore event details.	Design microsite; import guests; issue cards; track RSVP and preferences.
Arrival	Tap/scan at check-in; receive welcome and seating information.	Verify invite; check in; handle plus-ones and exceptions.
During	Redeem meal, drinks, photo booth, souvenirs, and permitted areas.	Configure entitlements; prevent duplicate redemption; monitor activity.
After	Tap same card for thank-you message, gallery, highlights, and guestbook.	Publish memory mode; manage retention and gallery access.

03 NFC card and physical invitation

- Premium customizable physical cards: names, couple/event branding, artwork, finishes, packaging, and optional luxury materials.
- NFC tap opens an event-specific personalized web experience; printed QR code provides a fallback for unsupported phones.
- Each card maps to an event and guest or household record through an opaque identifier; no personal details should be stored on the tag.
- Card activation, issuance, replacement, revocation, and reassignment from organizer dashboard.
- Support individual, family/household, plus-one, VIP, and staff passes with configurable access rules.
- Card continues to work across invitation, event-day, and post-event memory modes.
- Optional advanced secure NFC tags with cryptographic authentication for higher-assurance access.

04 Personalized event microsite and design studio

- Theme library: Romantic Floral, Modern Minimalist, Fairytale Garden, Destination Wedding, and custom premium themes.
- Mobile-first responsive UI with elegant typography, motion transitions, cinematic reveal, countdown, and optional sound with user controls.
- Personalized greeting by guest or household; event name, hosts, date/time, dress code, and custom welcome message.

- Couple or celebrant story, photo/video sections, entourage or speaker profiles, program, event timeline, and venue directions.
- Interactive maps, transport/parking instructions, accommodation suggestions, and destination travel itinerary.
- Gift registry, contribution instructions, FAQ, and contact/help information.
- Accessibility: readable contrast, keyboard support, reduced-motion mode, alt text, performance optimization.
- Organizer preview, draft/publish workflow, template settings, custom domain as premium option, and multilingual content later.

05 RSVP and guest management

- Guest import/export, deduplication, household grouping, plus-ones, invitation statuses, and event capacity.
- Personalized RSVP links and RSVP deadline; accept/decline/maybe and attendance count.
- Dietary preferences, meal selection, accessibility needs, and special requests with privacy controls.
- Seating and table assignments; optional visual seating/floor-plan designer.
- Guest categories and permission tiers: regular, VIP, family, vendor, staff, exhibitor, and speaker.
- Automated optional reminders and event updates via email/SMS/messaging integrations with consent and usage costs.
- Search, filters, manual edits, audit trail, and data export for coordinators.

06 Check-in and access control

- Staff PWA for NFC tap or QR scan; verify invitation validity, event match, guest status, and pass permissions.
- Display guest name, household, party size, seating/table, VIP marker, and relevant check-in instructions.
- Record timestamp, station, and staff operator; block or flag duplicate check-ins with configurable override.
- Separate venue/zone entitlements (e.g., VIP lounge, backstage, conference sessions).
- Staff roles, station assignment, manual lookup, and exception resolution.
- Offline-tolerant scanning and queued sync for weak connectivity; conflict resolution rules must be designed and tested.
- For high-security access, static NFC URLs alone are insufficient: use cryptographic tags or secondary verification.

07 Food, beverage, and booth redemption

- Create redeemable entitlements by guest, tier, session, location, time window, or quantity.
- Meal and dietary verification; configurable one-time or multi-use meal/drink passes.
- Photo booth session allocation, photo print claim, souvenir/giveaway claim, raffle or sponsor activation access.
- Station operator can tap/scan card, inspect eligibility, redeem, and see remaining balance.
- Prevent duplicate claims through server-side transaction rules, redemption history, and audit records.

- Optional booth-specific experiences: digital catalog, feedback form, coupon, loyalty reward, and lead capture with consent.
- Staff reversal/override workflow with authorization and reason logging.

08 Organizer dashboard and analytics

- Event overview: invitations issued, RSVP breakdown, expected attendance, actual check-ins, and no-shows.
- Live counters: check-ins, meals redeemed, beverage claims, photo booth sessions, souvenirs, and zone visits.
- Guest search, guest profile, seating overview, capacity, and entitlement management.
- Multiple event management, event cloning, branding/theme configuration, and staff assignment.
- Operational reporting: station throughput, usage by time, remaining inventory/claims, and exportable summaries.
- Post-event engagement: gallery views, guestbook participation, and optional engagement metrics with privacy safeguards.
- Alerts for unusual redemption attempts, sync conflicts, or approaching capacity limits.

09 Post-event memory mode

- Switch event microsite from invitation mode to memory mode without changing NFC card.
- Personalized thank-you page, event highlights, photos/videos, digital guestbook, and messages from hosts.
- Optional gallery organized by table or group; explicit permissions and consent for photo visibility.
- Download/share options subject to host permissions, storage policy, and copyright/privacy considerations.
- Optional anniversary updates and paid extended gallery hosting/archival plans.

10 Industry configurations

Industry	Adapted experience
Weddings / debuts	Invitation, RSVP, seating, meals, booth claims, gallery, thank-you.
Corporate events	Employee/guest registration, check-in, breakout sessions, lunch, VIP.
Conferences / expos	Attendee badges, session entry, booth lead capture, sponsor activations.
Hotels / resorts	Welcome cards, itinerary, spa/activity reservations, service links; lock access only with compatible integration.
Concerts / festivals	Wristband/card admission, VIP zones, merch, food/drink claims; stronger anti-fraud controls.
Schools / graduation	Guest/family admission, seating, program, attendance, controlled entry.

11 Suggested technical architecture

Layer	Recommended direction
Guest web	Next.js/React, mobile-first pages, animation with Framer Motion or GSAP, CDN and media optimization.
Organizer portal	Web admin with multi-event dashboard, theme editor, guest and access management.
Staff scanner	Installable PWA with QR scanning; NFC support via compatible Android devices/readers and supported browser APIs or native bridge.
Backend	Authenticated API, entitlement rules, atomic redemption transactions, webhooks, background jobs.
Database / storage	PostgreSQL for event/guest records; object storage for media; Redis optional for caching/queues.
Identity / security	Role-based access, tenant isolation, opaque pass IDs, encrypted transport, audit logging.
Operations	Backups, monitoring, rate limiting, CI/CD, staged deployments, event-day incident procedures.

Important hardware note: NFC reading behavior varies by device, OS, browser, and reader. Do not assume an iPhone browser or generic web PWA can read arbitrary NFC tags in all circumstances. Validate the staff hardware workflow early; QR is the universal fallback.

12 Core data model

- Tenant / organization; users and roles; events and event settings; themes and content blocks.
- Guests, households, RSVP responses, dietary preferences, seating, and invitation deliveries.
- Physical cards, pass identifiers, card status, guest assignments, and revocations.
- Stations/zones, access policies, entitlements, redemption transactions, and check-in logs.
- Media albums, guestbook entries, consent records, notifications, and audit events.

13 Security, privacy, and reliability requirements

- Treat NFC UID or a plain URL as an identifier, not proof of possession or strong authentication.
- Use unguessable tokens, rate limits, revocation, scoped permissions, and atomic one-time redemption.
- Minimize personal data on NFC cards; store guest information server-side with access controls.
- Apply Philippine Data Privacy Act requirements, privacy notice, lawful processing, retention schedule, and data subject requests.
- Explicit consent for photos, marketing, messaging, and exhibitor lead sharing where required.
- Event-day backup plan: printed QR, manual lookup, spare reader/phone, and offline procedures.
- Tenant isolation, encrypted backups, disaster recovery, logging, and monitoring.

14 Delivery roadmap and release scope

Phase	Scope
MVP - Phase 1	NFC/QR invitation; 3-5 themes; personalized microsite; RSVP; guest import; organizer dashboard; QR check-in; basic NFC verification; seating; meal/booth one-time redemption; audit log; post-event gallery.
Phase 2 - Premium	Visual seating planner; advanced animations; family passes; VIP zones; multi-station operations; offline sync; reports; photo booth integrations; messaging reminders; white-label organizer portal.
Phase 3 - Enterprise	Secure cryptographic NFC; conference/expo modules; exhibitor lead capture; hotel/vendor integrations; multi-language; API/webhooks; custom domains; advanced analytics and billing.

15 Business and monetization options

- Direct-to-couple packages: digital-only, NFC signature, and premium smart event management.
- Per-event organizer license, per-guest or per-card fees, and optional event-day staffing.
- White-label SaaS subscription for wedding coordinators, event planners, venues, and printers.
- Add-ons: premium card printing, bespoke motion design, custom domains, SMS, onsite support, and extended gallery storage.
- Enterprise event contracts and API/integration services for conferences and hospitality.

Illustrative Philippine pricing hypotheses (not validated): Digital Elegance PHP 4,999-7,999; NFC Signature PHP 12,999-19,999; Smart Wedding Premium PHP 24,999-39,999. Validate against actual card printing, staff, support, hosting, and acquisition costs.

16 Acceptance criteria for MVP

- Guest taps NFC card or scans QR and reaches the correct personalized microsite.
- RSVP is stored correctly, capacity rules are enforced, and organizers see status updates.
- Staff can check in invited guests, identify duplicates, and resolve exceptions with permissions.
- Configured meal/booth entitlement can be redeemed once; repeated attempts are rejected or flagged.
- Dashboard reflects check-in/redemption activity with an auditable history.
- Organizer can switch the event to memory mode and publish a guest-accessible gallery.
- Cross-device tests cover supported NFC devices, iOS/Android QR fallback, weak connectivity, and accessibility.
- Security tests cover token guessing, cross-event access, role permissions, duplicate claims, and lost-card revocation.

17 Open product decisions

- Brand clearance: MOMENTUS name, trademark classes, .com/.ph domains, and social handles require verification before launch.
- Card supplier, NFC tag model, printable materials, and whether secure tags are required for premium tiers.

- Target check-in devices/readers and whether native Android companion app is necessary.
- Guest identity model: individual versus household card and plus-one handling.
- Offline event-day policy and sync conflict resolution for one-time entitlements.
- Privacy retention period, photo sharing permissions, and post-event hosting duration.
- Pricing structure, vendor partnerships, staffing assumptions, and payment provider integration.

Document status: Product concept and proposed functional specification; not a final engineering contract, verified market study, or legal opinion.
